# Evolving Reinforcement Learning Algorithms

JD Co-Reyes, Yingjie Miao, Daiyi Peng, Esteban Real, Sergey Levine, Quoc V. Le, Honglak Lee, Aleksandra Faust

## Wide Choice of RL Algorithms

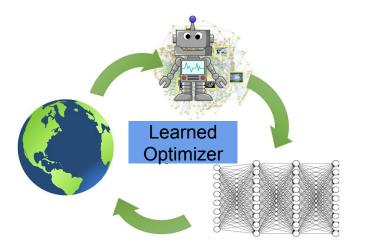

Desire: General purpose RL algorithms without manual effort. Problem: Can we meta-learn RL algorithms that generalize well on unseen tasks?

Evolving Reinforcement Learning Algorithms, Co-Reyes, Miao, Peng, Real, Levine, Le, Lee, Faust, ICLR 2021 https://sites.google.com/view/evolvingrl

## RL Algorithm as a Learned Optimizer

### reinforcement learning

- Learning procedure which takes in MDP and transforms experience into optimal behavior
- Can we meta-learn the optimizer?
  - Improved performance
  - Generalize to unseen environments
  - Interpretable
  - Scale with data and compute

### **Example: Simple Modifications to Existing Algorithms**

$$\delta^2 = (Q(s_t, a_t) - (r_t + \gamma * \max_a Q(s_{t+1}, a)))^2$$

[1] Kumar, A., Zhou, A., Tucker, G., & Levine, S. (2020). Conservative Q-Learning for Offline Reinforcement Learning. ArXiv, abs/2006.04779.

### Example: Simple Modifications to Existing Algorithms

CQL: adds scaled log softmax policy to TD error

$$\delta^2 + \beta \log \sum_{a} \exp\left(Q(s_t, a)\right) - Q(s_t, a_t)$$

[1] Kumar, A., Zhou, A., Tucker, G., & Levine, S. (2020). Conservative Q-Learning for Offline Reinforcement Learning. ArXiv, abs/2006.04779.

### Example: Simple Modifications to Existing Algorithms

CQL: adds scaled log softmax policy to TD error

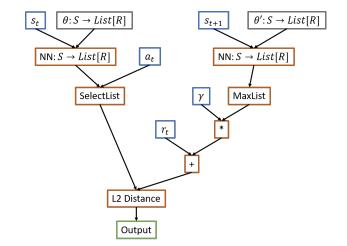

$$\delta^2 + \beta \log \sum_{a} \exp\left(Q(s_t, a)\right) - Q(s_t, a_t)$$

M-DQN: adds scaled log policy to reward

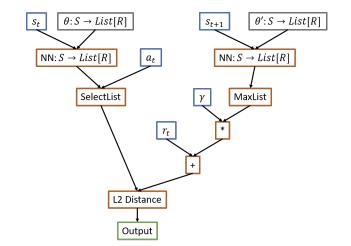

$$\hat{q}_{\text{m-dqn}}(r_t, s_{t+1}) = r_t + \alpha \tau \ln \pi_{\bar{\theta}}(a_t | s_t) + \gamma \sum_{a' \in \mathcal{A}} \pi_{\bar{\theta}}(a' | s_{t+1}) \Big( q_{\bar{\theta}}(s_{t+1}, a') - \tau \ln \pi_{\bar{\theta}}(a' | s_{t+1}) \Big)$$

## **Outer loop Optimization**

How to scale with compute?

### Meta-Learn RL Algorithms

Algorithm 1 Algorithm Evaluation,  $Eval(L, \mathcal{E})$ 

- 1: Input: RL Algorithm L, Environment  $\mathcal{E}$ , training episodes M
- 2: Initialize: Q-value parameters *θ*, target parameters *θ'* empty replay buffer *D*
- 3: for i = 1 to M do
- 4: for t = 0 to T do
- 5: With probability  $\epsilon$ , select a random action  $a_t$ ,
- 6: otherwise select  $a_t = \arg \max_a Q(s_t, a)$
- 7: Step environment  $s_{t+1}, r_t \sim \mathcal{E}(a_t, s_t)$
- 8:  $\mathcal{D} \leftarrow \mathcal{D} \cup \{s_t, a_t, r_t, s_{t+1}\}$
- 9: Update parameters  $\theta \leftarrow \theta \nabla_{\theta} L(s_t, a_t, r_t, s_{t+1}, \theta, \gamma)$ 
  - Update target  $\theta' \leftarrow \theta$
- 11: end for
- 12: Compute episode return  $R_m = \sum_{t=0}^{T} r_t$
- 13: end for

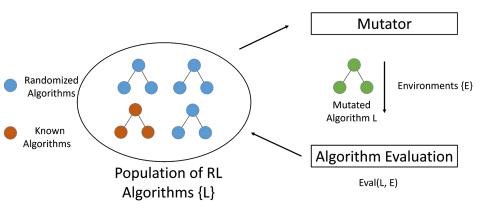

10:

- 14: **Output:**
- 15: Normalized training performance  $\frac{1}{M} \sum_{m=1}^{M} \frac{R_m R_{min}}{R_{max} R_{min}}$

Google Research

- Learn loss function for DQN style update procedure
- Score each algorithm with normalized training performance

## Meta-Learn RL Algorithms

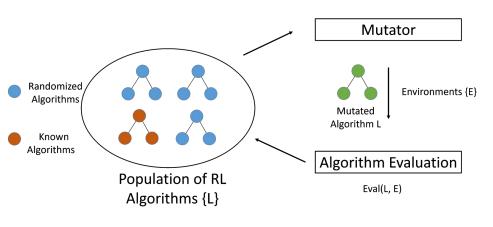

#### Algorithm 2 Evolving RL Algorithms

1: Input: Training environments  $\{\mathcal{E}\}$ , hurdle environment  $\mathcal{E}_h$ , hurdle threshold  $\alpha$ , optional existing algorithm A 2: Initialize: Population P of RL algorithms  $\{L\}$ , history H, randomized inputs I. If bootstrapping, initialize P with A. 3: Score each L in P with H[L].score  $\leftarrow \sum_{\mathcal{E}} \operatorname{Eval}(L, \mathcal{E})$ 4: for c = 0 to C do 5: Sample tournament  $T \sim Uniform(P)$ Parent algorithm  $L \leftarrow$  highest score algorithm in T 6: 7: Child algorithm  $L' \leftarrow Mutate(L)$  $H[L'].hash \leftarrow \operatorname{Hash}(L'(I))$ 8: 9: if H[L'].hash was new and  $Eval(L', \mathcal{E}_h) > \alpha$  then 10: H[L'].score  $\leftarrow \sum_{\mathcal{E}} \operatorname{Eval}(L', \mathcal{E})$ 11: end if 12: Add L' to population P13: Remove oldest L from population 14: end for 15: **Output:** Algorithm L with highest score

Regularized Evolution for outer loop optimization

## Optimizations

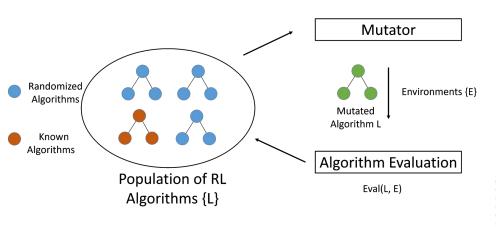

### Algorithm 2 Evolving RL Algorithms

1: Input: Training environments  $\{\mathcal{E}\}$ , hurdle environment  $\mathcal{E}_h$ , hurdle threshold  $\alpha$ , optional existing algorithm A 2: Initialize: Population P of RL algorithms  $\{L\}$ , history H, randomized inputs I. If bootstrapping, initialize P with A. 3: Score each L in P with H[L].score  $\leftarrow \sum_{\mathcal{E}} \operatorname{Eval}(L, \mathcal{E})$ 4: for c = 0 to C do 5: Sample tournament  $T \sim Uniform(P)$ Parent algorithm  $L \leftarrow$  highest score algorithm in T 6: 7: Child algorithm  $L' \leftarrow Mutate(L)$ 8:  $H[L'].hash \leftarrow \operatorname{Hash}(L'(I))$ 9: if H[L'].hash was new and  $Eval(L', \mathcal{E}_h) > \alpha$  then 10: H[L'].score  $\leftarrow \sum_{\mathcal{E}} \operatorname{Eval}(L', \mathcal{E})$ 11: end if 12: Add L' to population P13: Remove oldest L from population 14: end for

**Google** Research

- 15: **Output:** Algorithm L with highest score
- Don't reevaluate functionally equivalent or duplicate programs
- Saves 70% of computation

## **Optimizations**

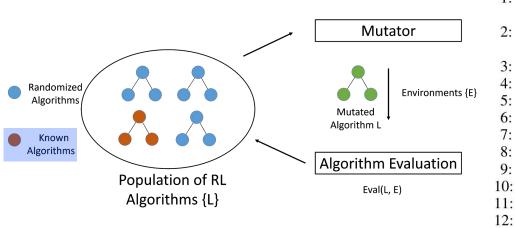

### Algorithm 2 Evolving RL Algorithms

- 1: Input: Training environments  $\{\mathcal{E}\}$ , hurdle environment  $\mathcal{E}_h$ , hurdle threshold  $\alpha$ , optional existing algorithm A
- 2: Initialize: Population P of RL algorithms  $\{L\}$ , history H, randomized inputs I. If bootstrapping, initialize P with A.

**Google** Research

- 3: Score each L in P with H[L].score  $\leftarrow \sum_{\mathcal{E}} \operatorname{Eval}(L, \mathcal{E})$
- 4: for c = 0 to C do
- 5: Sample tournament  $T \sim Uniform(P)$
- Parent algorithm  $L \leftarrow$  highest score algorithm in T 6:
- Child algorithm  $L' \leftarrow Mutate(L)$ 7:
- $H[L'].hash \leftarrow \operatorname{Hash}(L'(I))$ 8:
- 9: if H[L'].hash was new and  $Eval(L', \mathcal{E}_h) > \alpha$  then 10:
  - H[L'].score  $\leftarrow \sum_{\mathcal{E}} \operatorname{Eval}(L', \mathcal{E})$
- 11: end if
- 12: Add L' to population P
- 13: Remove oldest L from population
- 14: end for
- 15: **Output:** Algorithm L with highest score
- Stop early if performance on hurdle environment is bad
- Saves additional 30% of computation

### Bootstrap from existing algorithms

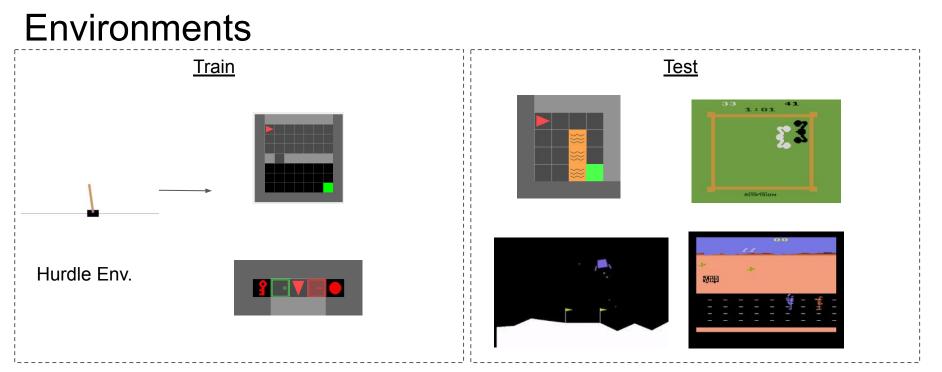

### Algorithm 2 Evolving RL Algorithms

- 1: **Input:** Training environments  $\{\mathcal{E}\}$ , hurdle environment  $\mathcal{E}_h$ , hurdle threshold  $\alpha$ , optional existing algorithm A
- 2: Initialize: Population P of RL algorithms  $\{L\}$ , history H, randomized inputs I. If bootstrapping, initialize P with A.
- 3: Score each L in P with H[L].score  $\leftarrow \sum_{\mathcal{E}} \operatorname{Eval}(L, \mathcal{E})$
- 4: for c = 0 to C do
- 5: Sample tournament  $T \sim Uniform(P)$
- 6: Parent algorithm  $L \leftarrow$  highest score algorithm in T
- 7: Child algorithm  $L' \leftarrow Mutate(L)$
- 8:  $H[L'].hash \leftarrow \operatorname{Hash}(L'(I))$
- 9: if H[L'].hash was new and  $Eval(L', \mathcal{E}_h) > \alpha$  then

$$H[L'].score \leftarrow \sum_{\mathcal{E}} \operatorname{Eval}(L', \mathcal{E})$$

- 11: **end if**
- 12: Add L' to population P
- 13: Remove oldest *L* from population
- 14: end for
- 15: Output: Algorithm L with highest score
- Can initialize population with existing algorithms

- Want training environments that are computationally cheap but diverse
- Test environments include completely different state and action sizes (including image observations)

Evolving Reinforcement Learning Algorithms, Co-Reyes, Miao, Peng, Real, Levine, Le, Lee, Faust, ICLR 2021 https://sites.google.com/view/evolvingrl

### Learned Algorithm 1: DQN\_Clipped as Constrained Optimization

$$Y_t = r_t + \gamma * \max_a Q_{targ}(s_t, a), \text{ and } \delta = Q(s_t, a_t) - Y_t.$$

$$L_{\text{DQNClipped}} = \max\left[Q(s_t, a_t), \delta^2 + Y_t\right] + \max\left[Q(s_t, a_t) - Y_t, \gamma(\max_a Q_{targ}(s_t, a))^2\right]$$

### Learned Algorithm 1: DQN\_Clipped as Constrained Optimization

$$Y_{t} = r_{t} + \gamma * \max_{a} Q_{targ}(s_{t}, a), \text{ and } \delta = Q(s_{t}, a_{t}) - Y_{t}.$$

$$L_{DQNClipped} = \max \left[ Q(s_{t}, a_{t}), \delta^{2} + Y_{t} \right] + \max \left[ Q(s_{t}, a_{t}) - Y_{t}, \gamma(\max_{a} Q_{targ}(s_{t}, a))^{2} \right]$$

$$Case 2: \left. Q(s_{t}, a_{t}) - Y_{t} > \delta^{2} \right|$$

$$Minimize Q$$

$$Case 3: \left. Q(s_{t}, a_{t}) - Y_{t} \le \delta^{2} \right|$$

$$Minimize normal TD error$$

Evolving Reinforcement Learning Algorithms, Co-Reyes, Miao, Peng, Real, Levine, Le, Lee, Faust, ICLR 2021 https://sites.google.com/view/evolvingrl

### Learned Algorithm 1: DQN\_Clipped as Constrained Optimization

$$Y_{t} = r_{t} + \gamma * \max_{a} Q_{targ}(s_{t}, a), \text{ and } \delta = Q(s_{t}, a_{t}) - Y_{t}.$$

$$L_{DQNClipped} = \max \left[Q(s_{t}, a_{t}), \delta^{2} + Y_{t}\right] + \max \left[Q(s_{t}, a_{t}) - Y_{t}, \gamma(\max_{a} Q_{targ}(s_{t}, a))^{2}\right]$$

$$Case 2: Q(s_{t}, a_{t}) - Y_{t} > \delta^{2}$$

$$Minimize Q$$

$$Case 3: Q(s_{t}, a_{t}) - Y_{t} \le \delta^{2}$$

$$Minimize normal TD error$$

Evolving Reinforcement Learning Algorithms, Co-Reyes, Miao, Peng, Real, Levine, Le, Lee, Faust, ICLR 2021 https://sites.google.com/view/evolvingrl

### Learned Algorithm 2: DQN\_Reg as Soft Constraint

$$Y_t = r_t + \gamma * \max_a Q_{targ}(s_t, a), \text{ and } \delta = Q(s_t, a_t) - Y_t.$$

 $L_{\text{DQNReg}} = 0.1 * Q(s_t, a_t) + \delta^2$ 

### Learned Algorithm 2: DQN\_Reg as Soft Constraint

$$Y_t = r_t + \gamma * \max_a Q_{targ}(s_t, a), \text{ and } \delta = Q(s_t, a_t) - Y_t.$$

$$L_{\rm DQNReg} = 0.1 * Q(s_t, a_t) + \delta^2$$

$$L_{CQL} = \beta \log \sum_{a} \exp \left(Q(s_t, a)\right) - Q(s_t, a_t) + \delta^2$$

### Learned Algorithm 2: DQN\_Reg as Soft Constraint

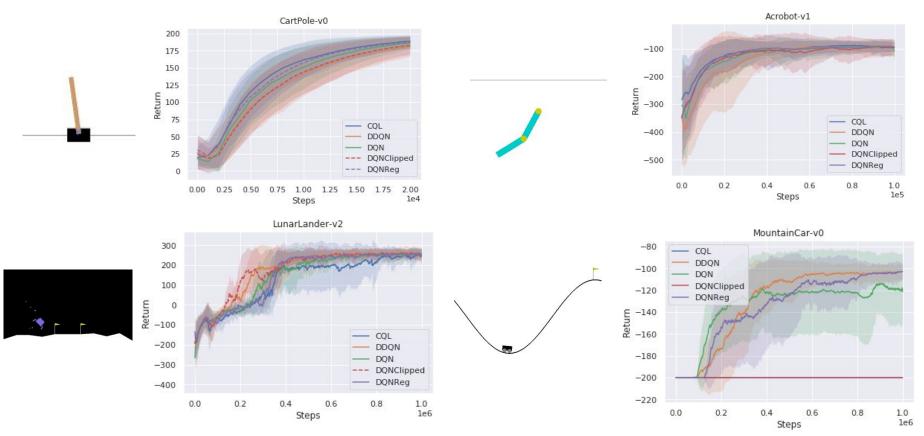

$$Y_t = r_t + \gamma * \max_a Q_{targ}(s_t, a), \text{ and } \delta = Q(s_t, a_t) - Y_t.$$

$$L_{\text{DQNReg}} = 0.1 * Q(s_t, a_t) + \delta^2$$

$$L_{CQL} = \beta \log \sum_{a} \exp \left( Q(s_t, a) \right) - Q(s_t, a_t) + \delta^2$$

 DQNReg as version of entropy regularization that penalizes Q-values on dataset to prevent overfitting

### Generalize to Unseen Environments

Asteroid	1364.5	734.7	2097.5	2390.4
Bowling	50.4	68.1	40.1	80.5
Boxing	88.0	91.6	94.6	100.0
RoadRunner	39544.0	44127.0	35466.0	65516.0

Baselines taken from reported numbers.

Learned algorithm (DQNReg) generalizes to Atari games when meta-training was on non-image based environments. Not tuned to Atari games.

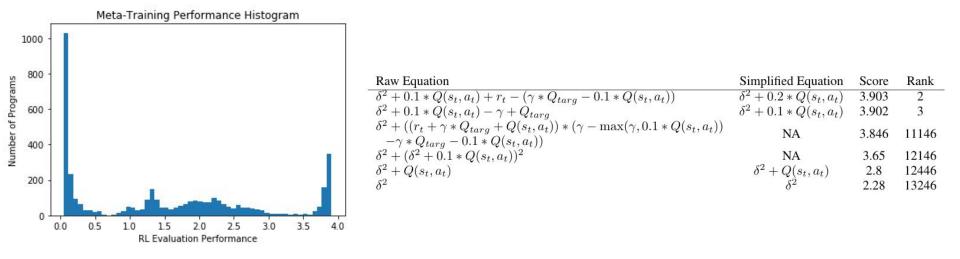

## DQNReg

DQN overestimates Q values while learned algorithms DQNClipped and DQNReg overcome this issue and underestimate Q values

Evolving Reinforcement Learning Algorithms, Co-Reyes, Miao, Peng, Real, Levine, Le, Lee, Faust, ICLR 2021 https://sites.google.com/view/evolvingr

### Learning Convergence

### Top performing algorithms have similar structure

### With different training environments or initialization, could find other families of models with better performance Google Research

### Conclusion

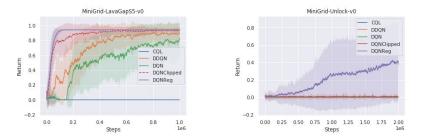

• RL algorithm as a computational graph

• Evolve new RL algorithms

 Learned algorithms generalize to unseen environments
