

Image Clustering Conditioned on Text Criteria

Sehyun Kwon, Jaeseung Park, Minkyu Kim, Jaewoong Cho, Ernest K. Ryu and Kangwook Lee

ICLR 2024

KRAFTON

Motivation

Ex) CIFAR-10, CIFAR-100, STL-10, ImageNet, ...

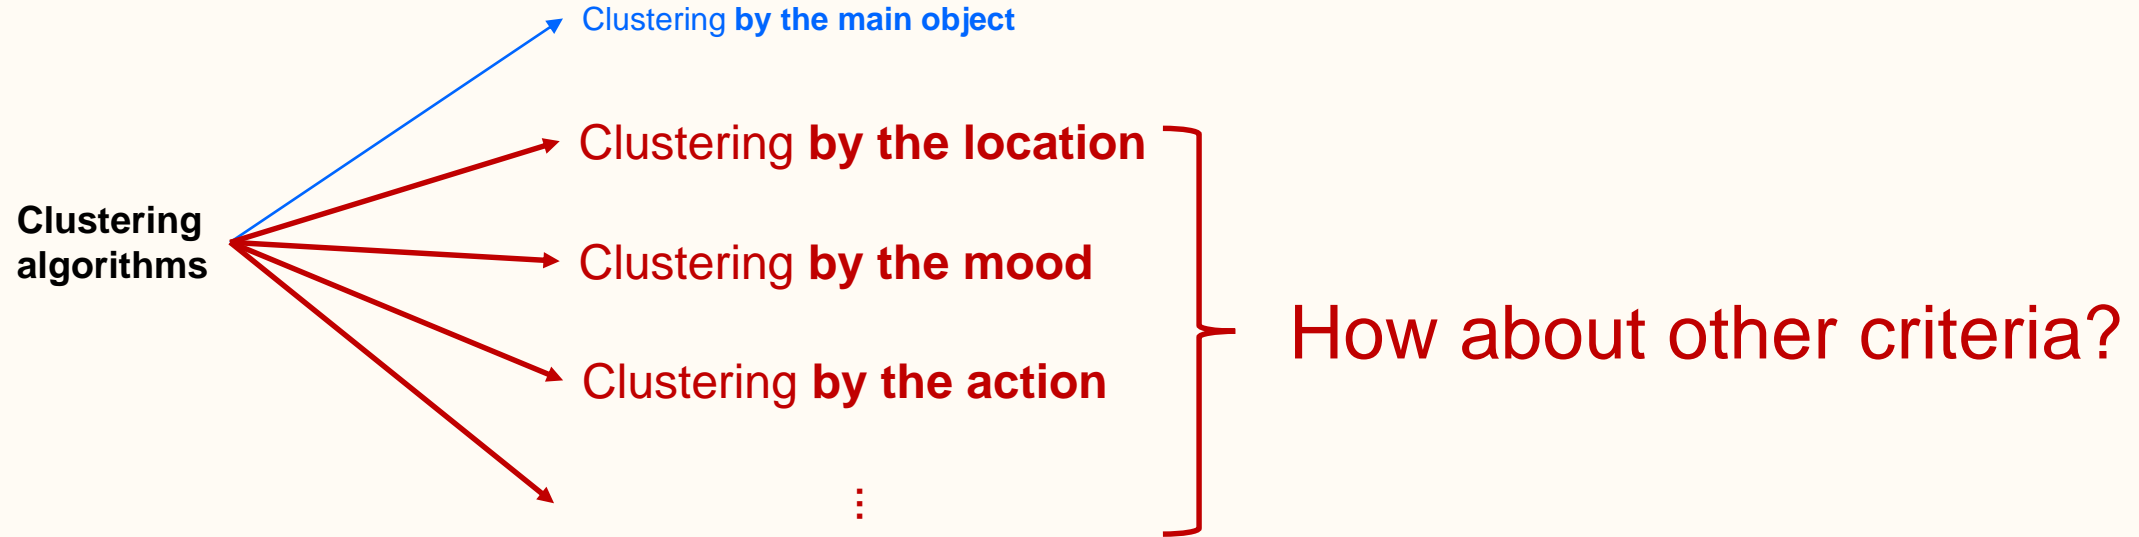

Recent image clustering algorithms work well on datasets similar to ImageNet, most of which are labeled based on **the main object** in the image, such as dogs 🐶, cats 🐱, cars 🚗, airplanes ✈️, etc.

**Clustering
algorithms**

Work well !!
→

**Clustering
by the main object**

Motivation

Unfortunately, all existing image clustering algorithms share a **limitation** - you **can't directly specify** the clustering criterion. Instead, you **indirectly specify** it by choosing a feature extractor, distance metric, etc.

Ex) In contrastive learning, carefully designed data augmentation is needed. And this is very non-trivial.

IC|TC: Image Clustering Conditioned on Text Criteria

IC|TC can specify the clustering criterion by *words!*

"Cluster these images by based on the mood"

"Cluster these images by based on the action"

Adventurous:   ...

Focused:   ...

Relaxed:   ...

⋮

Applauding:   ...

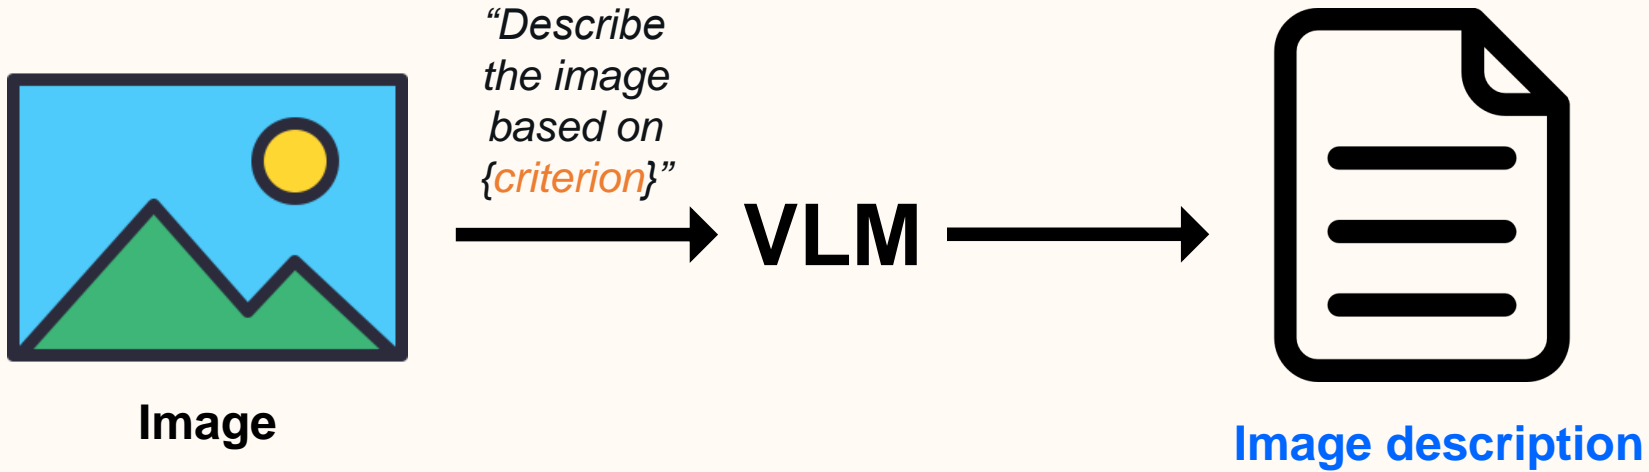

Jumping:   ...

Interacting with a horse:   ...

⋮

Method (Step 1)

Given clustering **crit**erion,
transforming images to **image descriptions!**

Example:

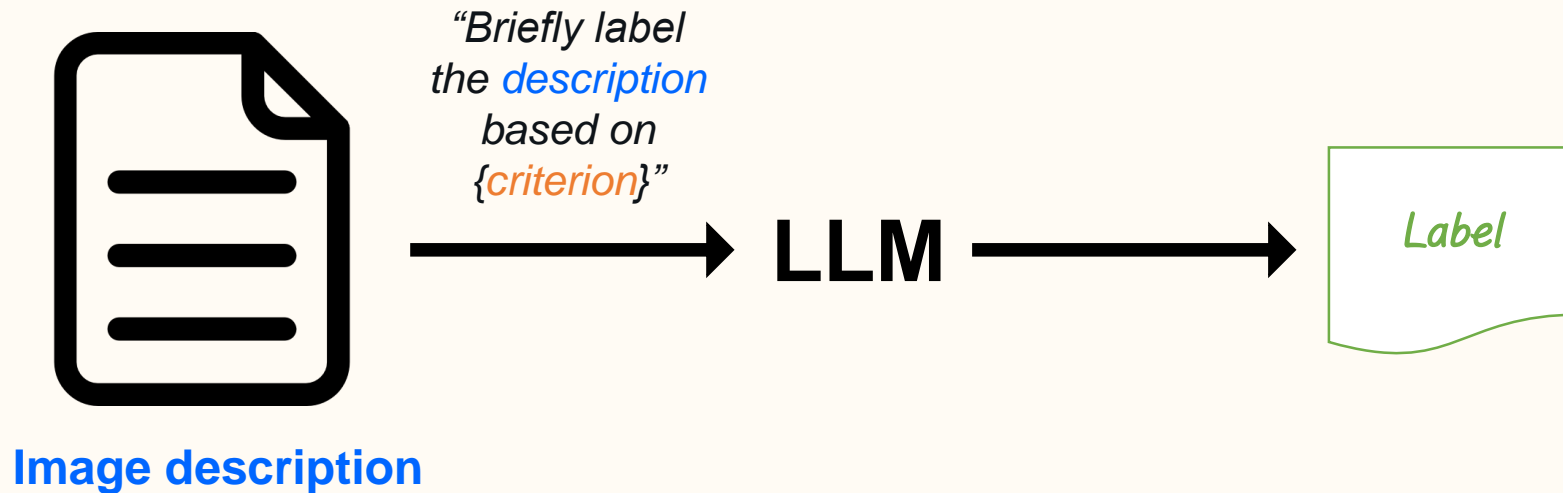

"Describe
the image
based on
{Action}"

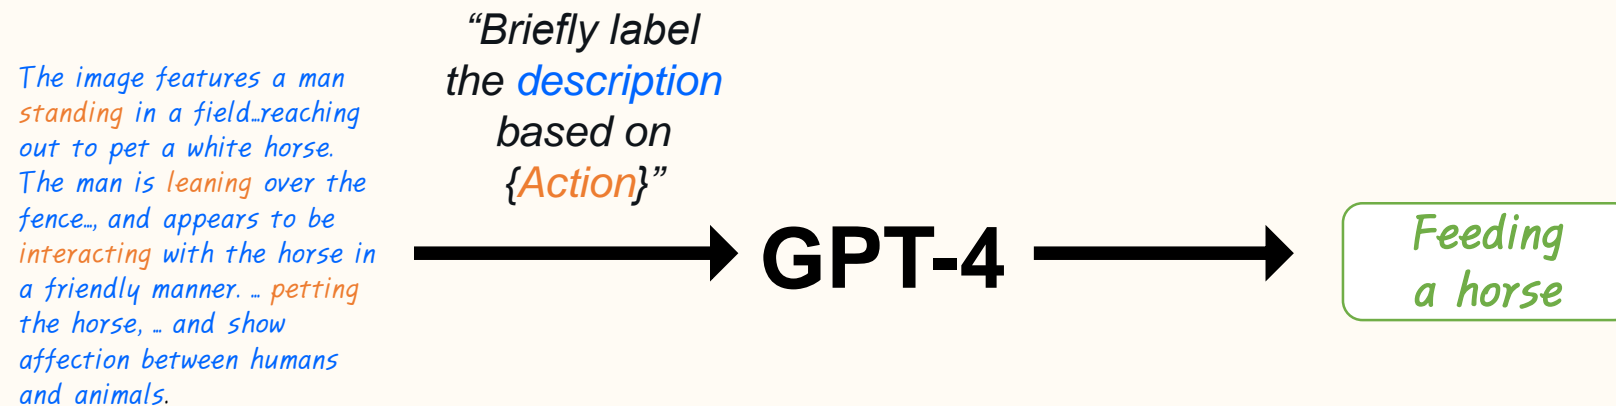

LLaVA

The image features a man standing in a field...reaching out to pet a white horse. The man is leaning over the fence... and appears to be interacting with the horse in a friendly manner. ... petting the horse, ... and show affection between humans and animals.

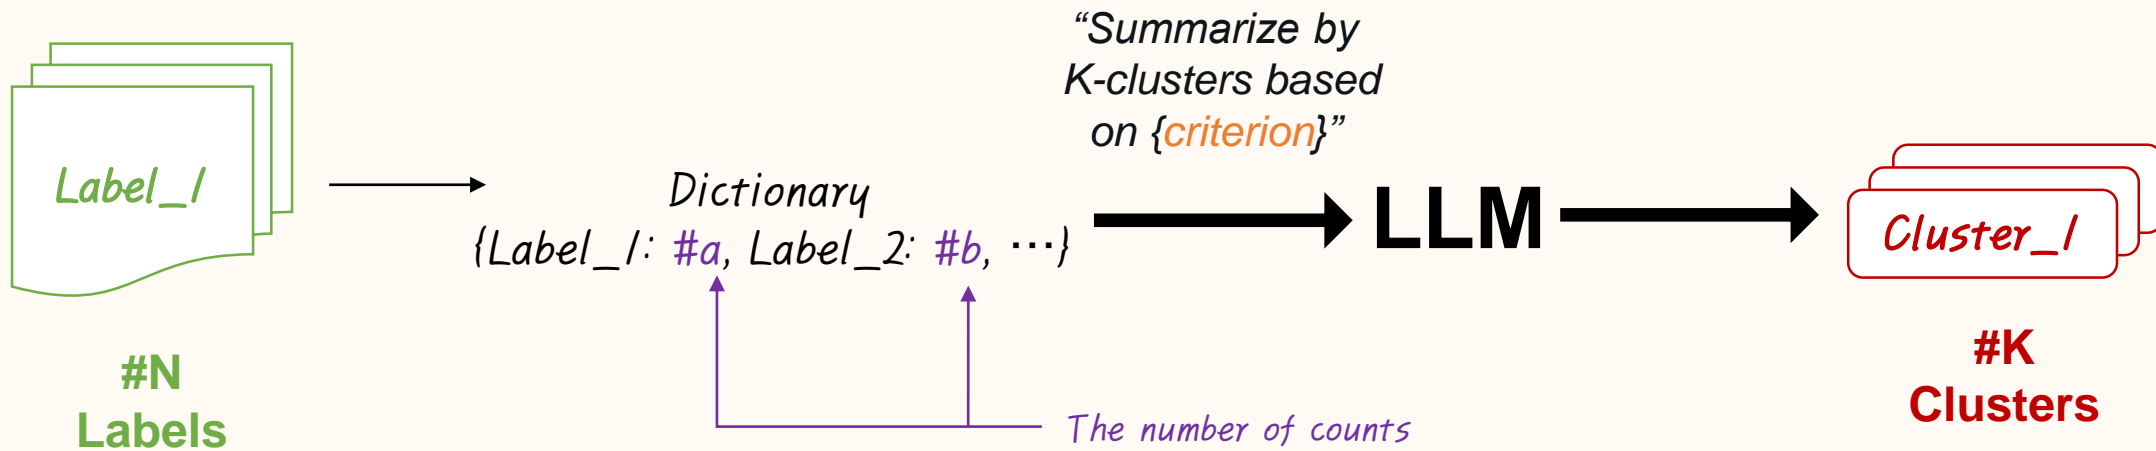

Method (Step 2a) **Reducing** the amount of description through raw labeling!

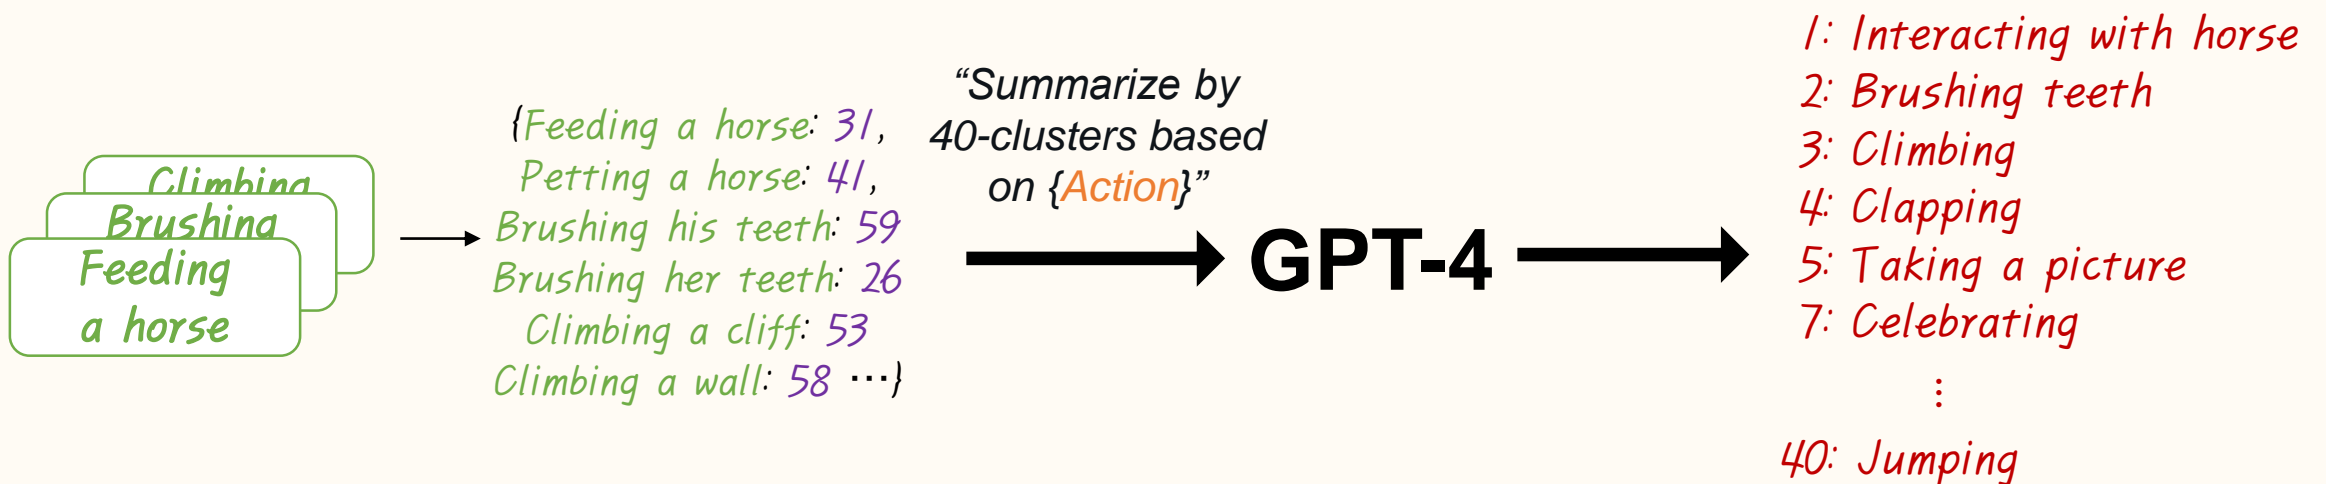

Example:

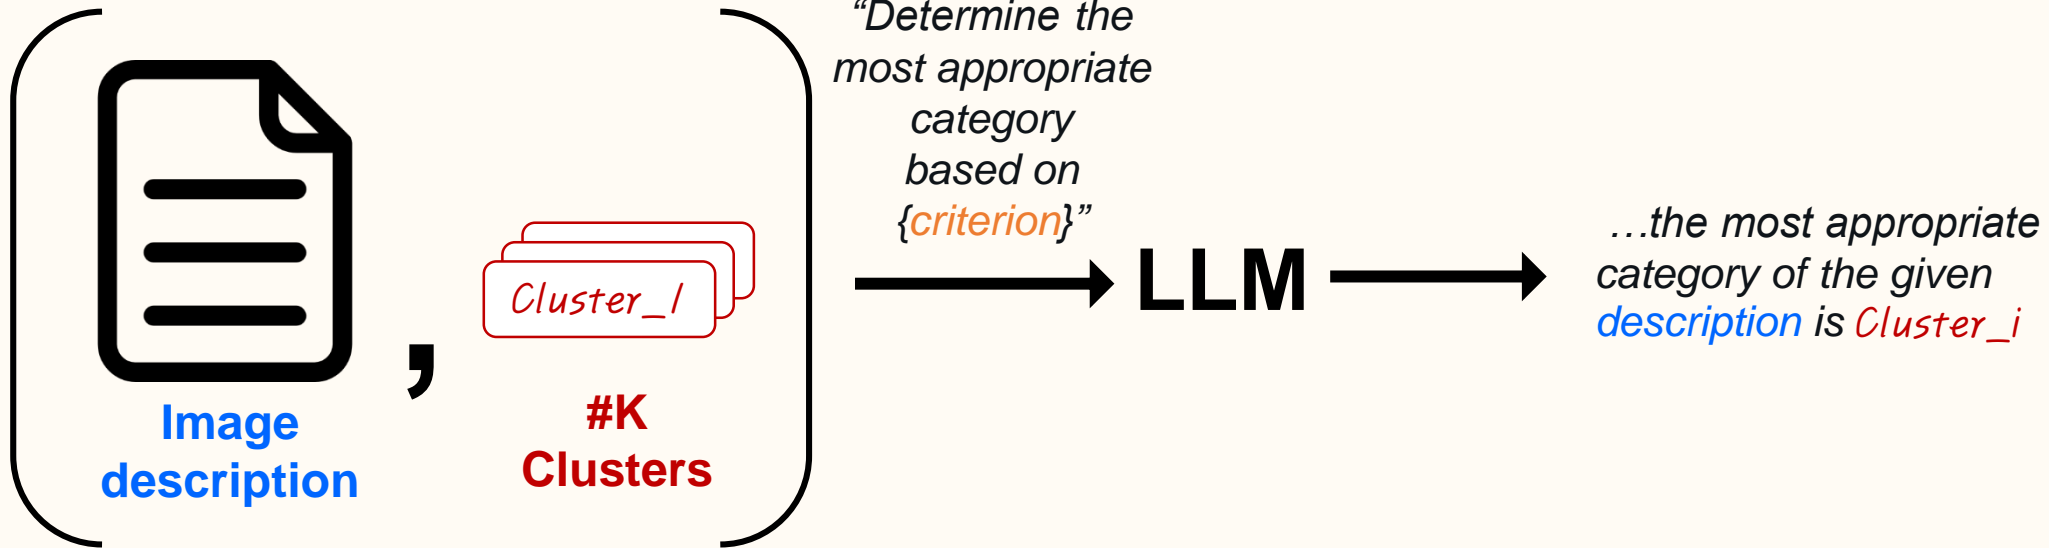

Method (Step 2b) Obtaining **cluster names** by LLM!

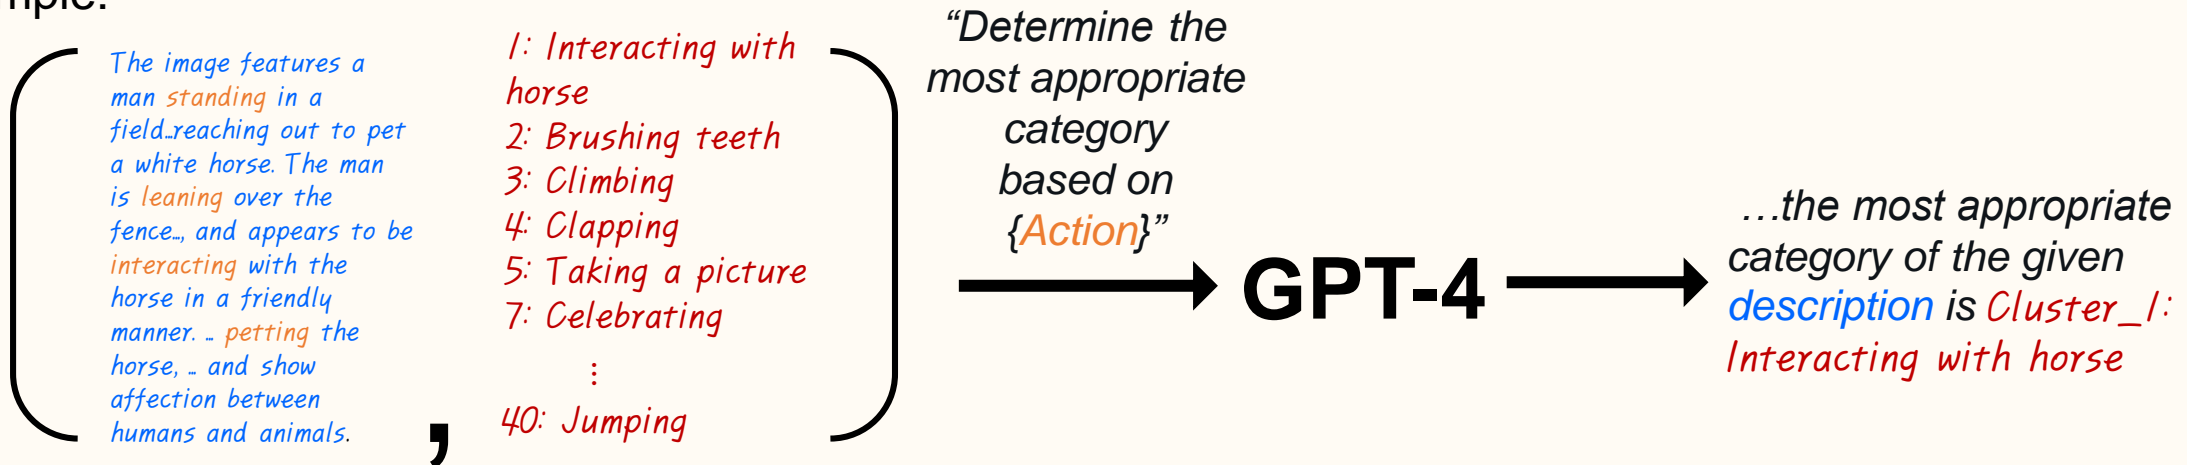

Example:

Method (Step 3) Classifying image description to appropriate **cluster name** by LLM!

Example:

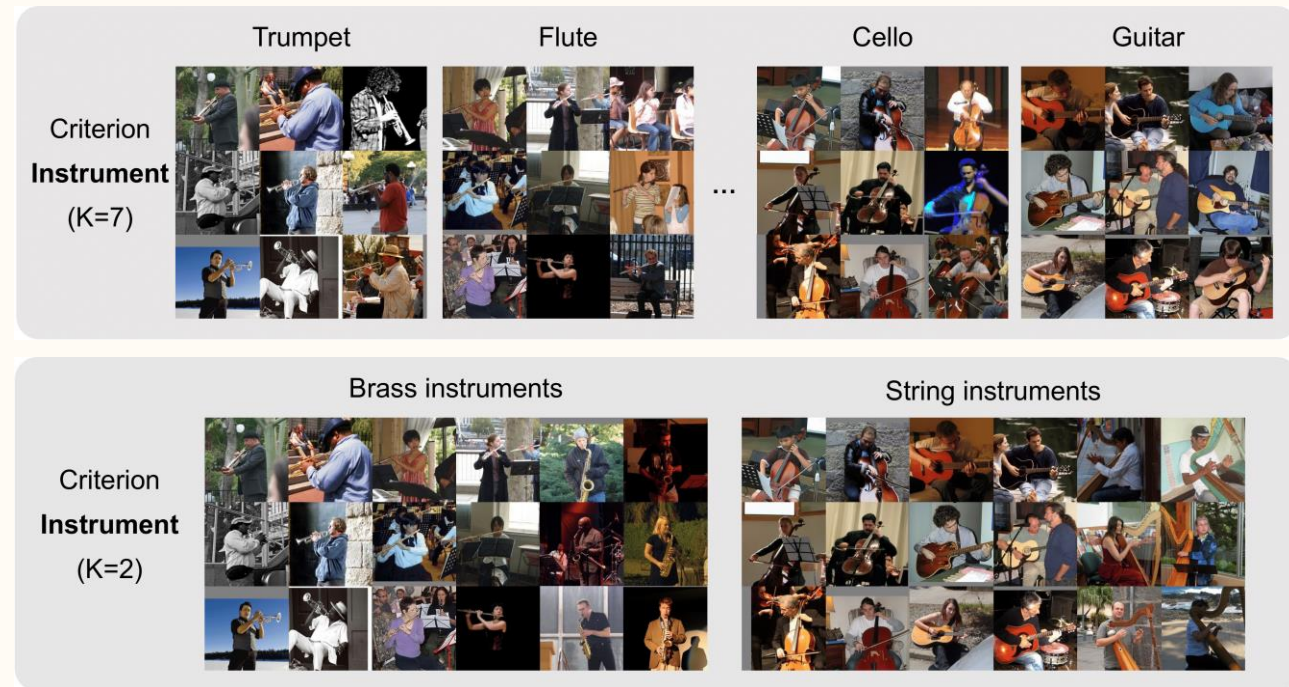

Experiments - Clustering by **varying criteria**

IC|TC can do the clustering by **varying clustering criterion** at Stanford-40-Actions dataset.

Experiments - Clustering by varying the number of clusters

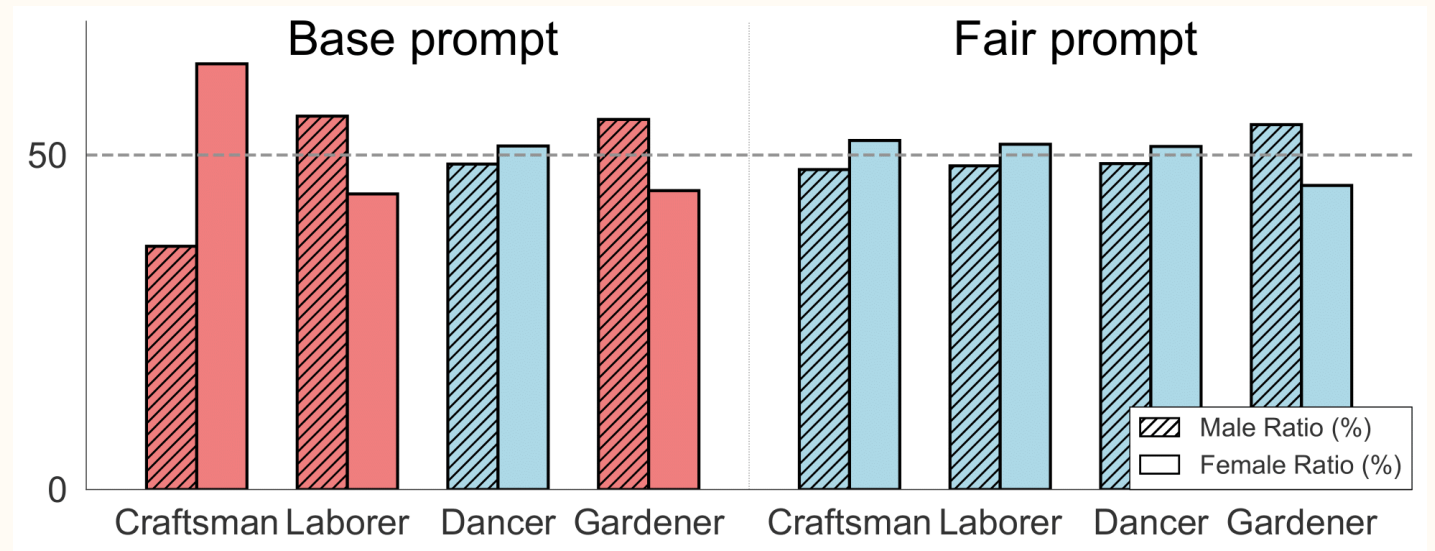

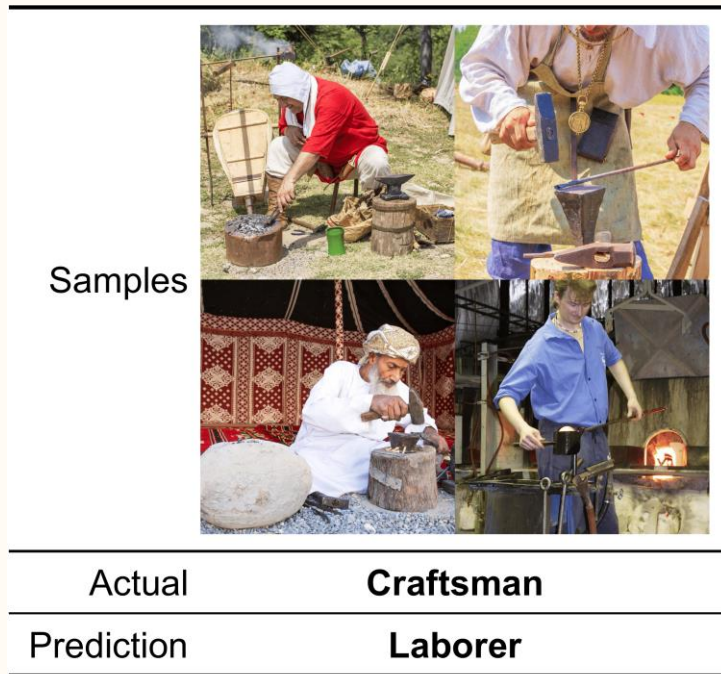

IC|TC automatically find the hierarchical clustering by varying the number of clusters at People-Playing-Musical-Instrument (PPMI) dataset.

Experiments – Fair clustering by text criterion refinement

IC|TC can easily edit the clustering result when user don't like it.
And this becomes easily achievable through text criterion refinement.

Simply adding a prompt: *"Do not consider gender"*
